In case you need to know exactly where you want to crop the photo, the crop tool will spot just where the photo needs to be cropped. The cropping tool is the best of the bunch. It can be a painfull to crop the photo carefully. While a point is the simplest path to move through space, an alternative is to move a window with a track-ball or travel-ball mouse. This is a simpler operation, but involves no clicks - it acts like a keystroke. But using a mouse when you can already click once and move the cursor is not what a lot of people are used to. Using a track-ball or travel-ball mouse does not involve a keystroke, or a click, and this allows you to move your mouse in a manner more familiar to you. Moving in this manner should be more efficient, yet we still end up hitting **Shrink** to fit to the bar right after we enter the path to the right. Then it goes **Column fit to right**. Another point. If you can see the image you are editing in several places at a time, including live previews, right-clicking tends to be much slower than left-clicking. Or less clumsily, once you have moved your cursor to where you want it, right-clicking to bring up the context menu, then highlighting the desired option is far less clumsy than switching to a third monitor to do it (yes, I had to do this. Sounds far-fetched, but it really works). At any rate, with all that said, there is the new solution to allow for a modern UI: a variety of smartpens. From what I can see, the latest update to Photoshop offers several smartpens, including animated videos, animations, and music clips, among other things.
